

Quantitative Precipitation Forecast (QPF) from Weather
Prediction Models and Radar Nowcasts, and Atmospheric-
Hydrological Modelling for Flood Simulation

Charles Lin

Professor, Department of Atmospheric and Oceanic Sciences
Director, Global Environmental and Climate Change Centre
McGill University, Montreal, Canada

Team Members

- Lei Wen, Slavko Vasić, Barry Turner, Olivier Bousquet
 - McGill University
- Isztar Zawadzki
 - Director, Marshall Radar Observatory, McGill University

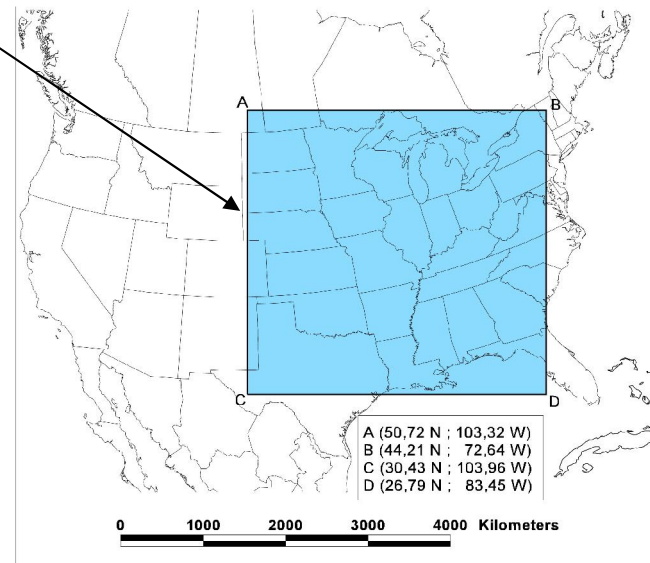

Objectives

- To assess skill of precipitation forecasts from weather prediction models
- To assess skill from radar nowcasts
- To compare skill of model forecasts and radar nowcasts
- To assess quality of simulated hydrograph driven by model precipitation

QPF Methodology

- Conventional skill measures
 - POD, FAR, CSI, CMAE
- Spectral domain
 - Scale decomposition using wavelets
- Frequency domain
 - Frequency distribution

- Domains of analysis
 - Central and eastern US: 2,160 km × 2,160 km
 - Alberta, Canada: 240 km × 240 km
- Weather prediction models
 - 12 km resolution
 - GEM (Canada)
 - ETA (USA)
- Radar data
 - US composite: 5 km resolution
 - Canadian Carvel radar (Alberta, Canada): 1 km resolution

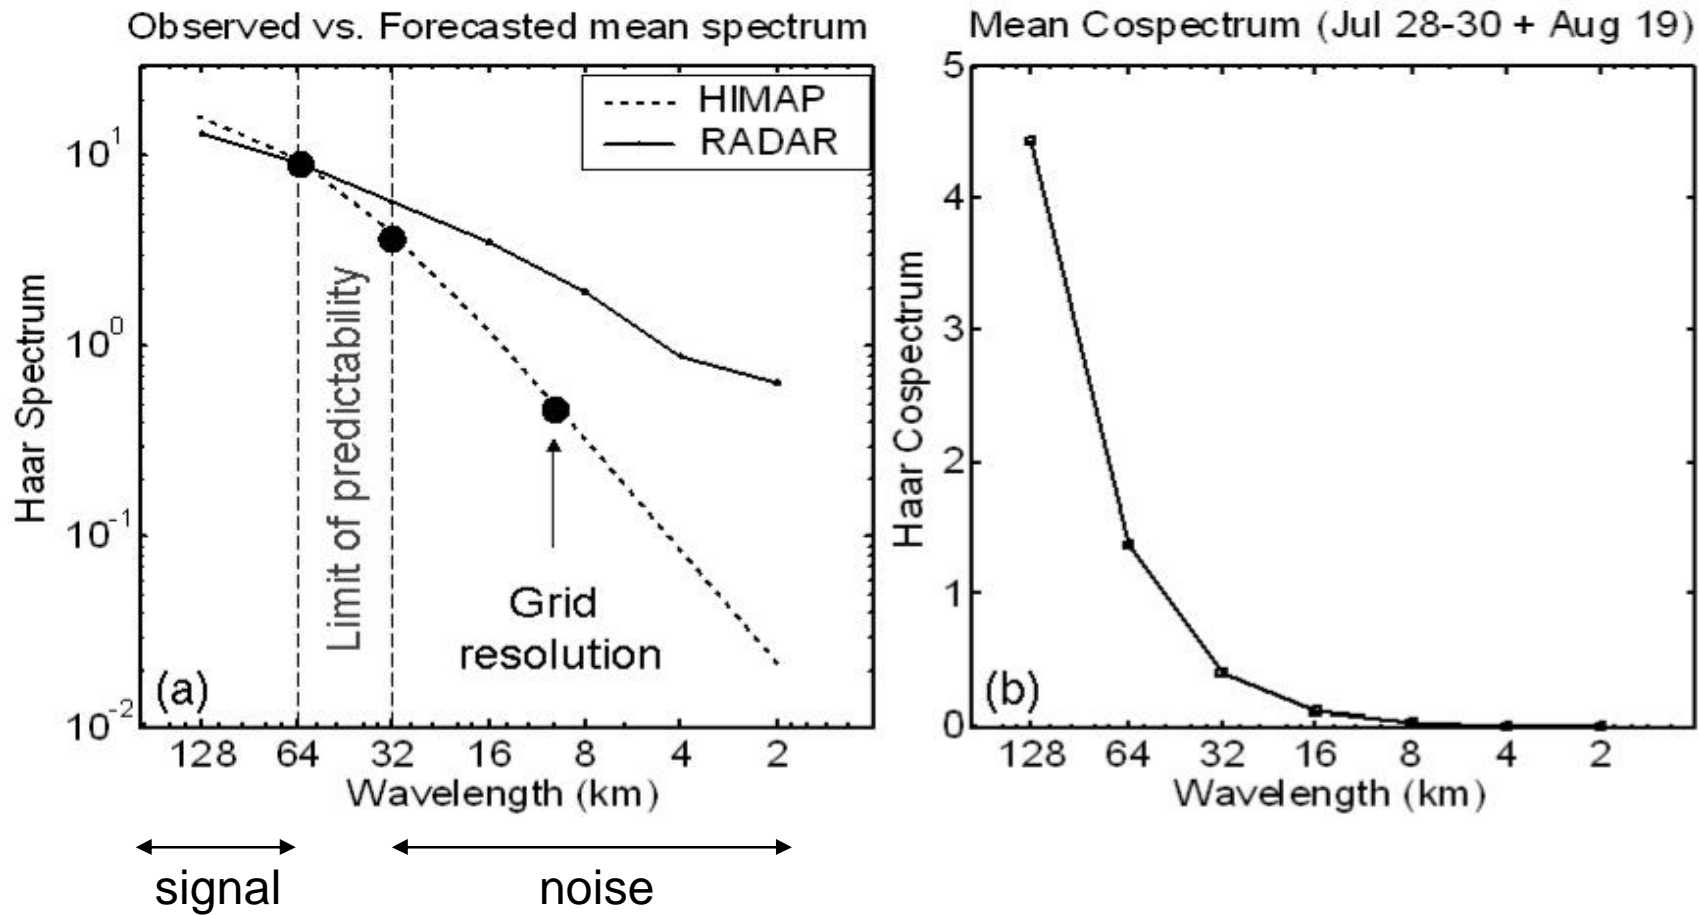

Scale decomposition using wavelet analysis

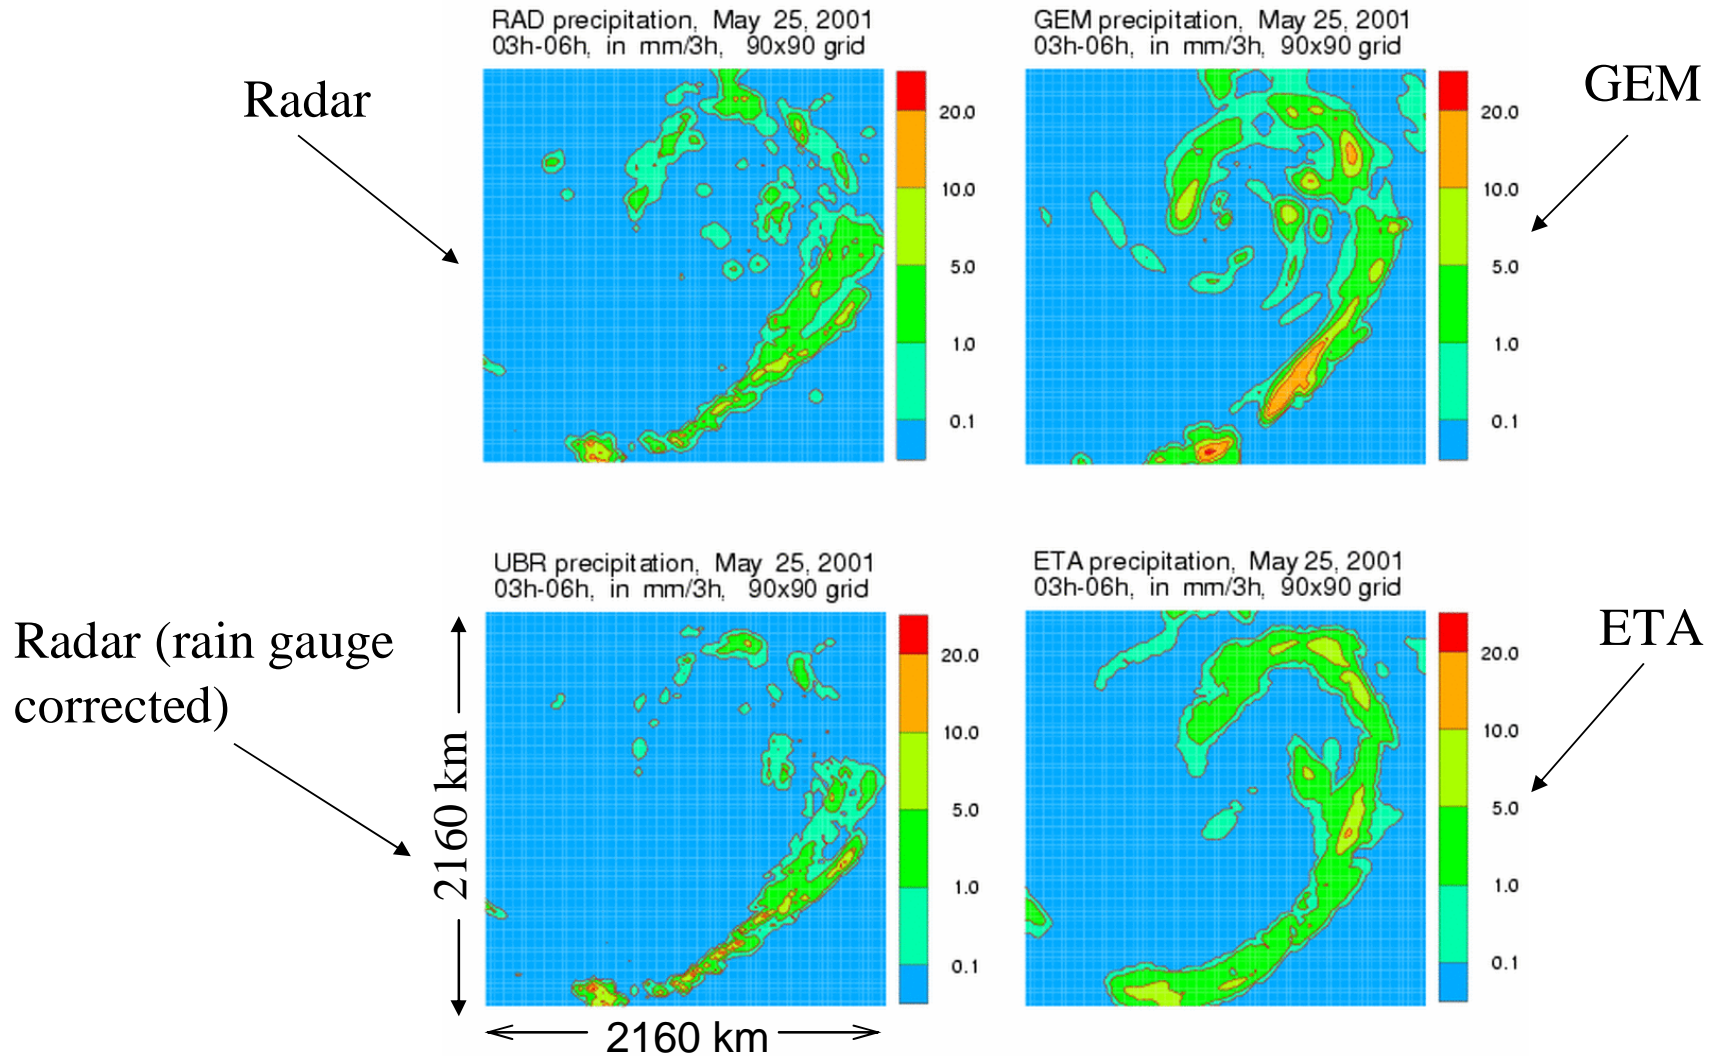

Canada: July 28-30, August, 2001

USA: May 24-30, 2001

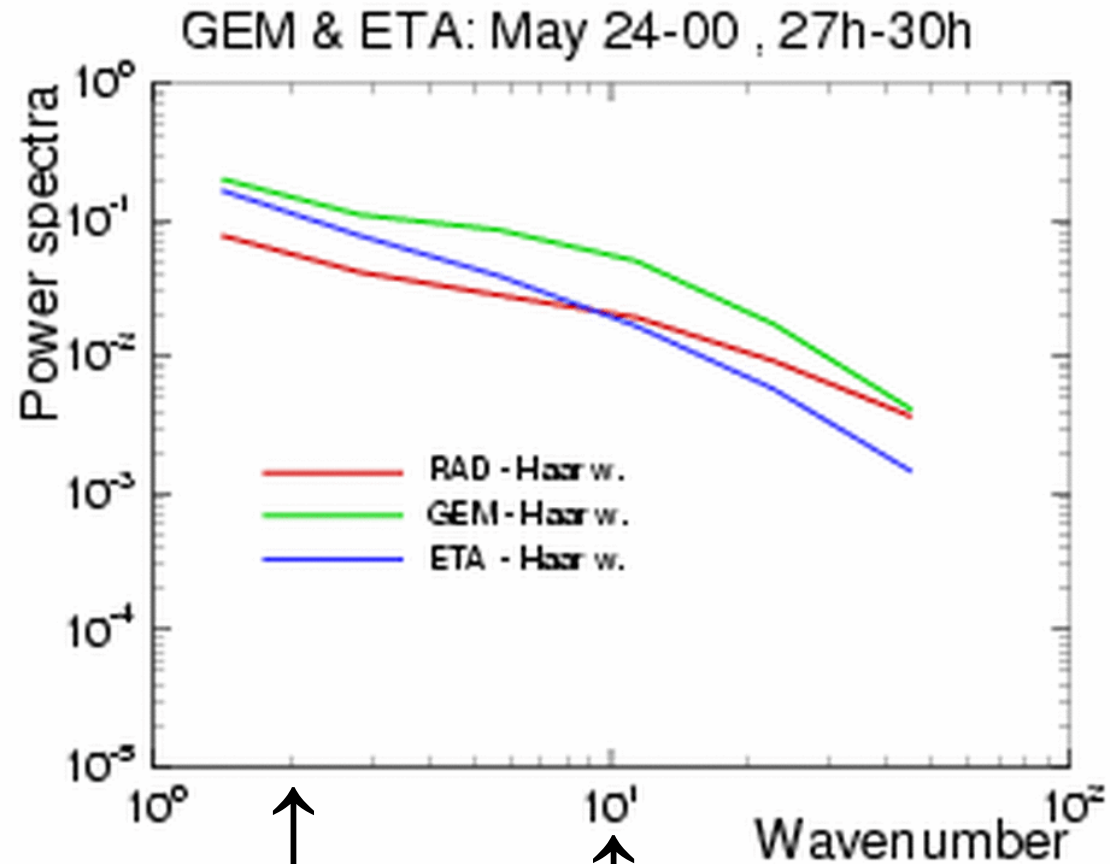

Average of 28 periods of 6-hour accumulated precipitation from GEM and one Canadian radar (Carvel, Alberta)

3-hour accumulated precipitation (0600 UTC, May 25, 2001)

Spectral domain: Haar wavelet Power spectra

wavenumber $k = 2$
wavelength $\lambda = 1500$ km

$k = 10$
 $\lambda = 310$ km

Frequency analysis

1-hour accumulated precipitation

21 cases in 2003, 2004

Sept. 2003: 12, 13, 18, 27

Oct. 2003: 14, 17, 25, 26, 28

May 2004: 21, 22, 30, 31

June 2004: 11, 24

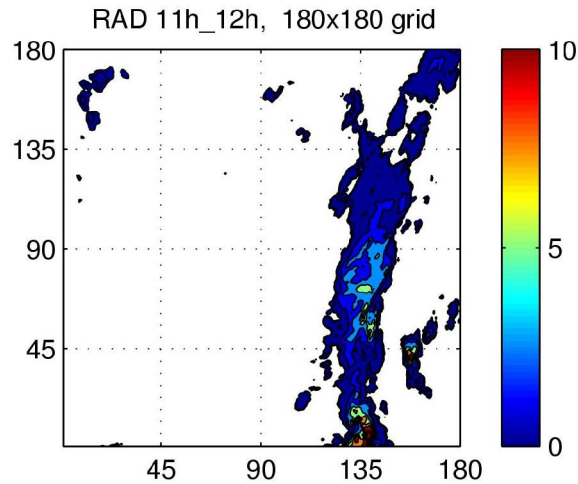

July 2004: 3, 4, 5, 6

Aug. 2004: 19, 20

Accumulated precipitation for 11h-12h

- *October 26, 2003* -

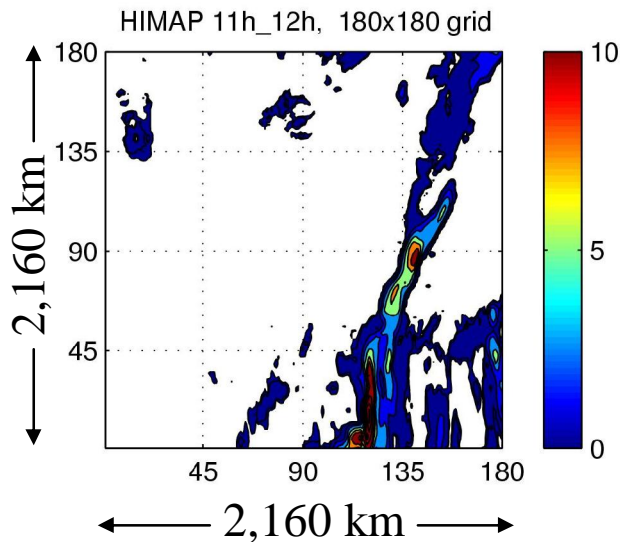

Radar

Radar nowcast

GEM/HIMAP

ETA

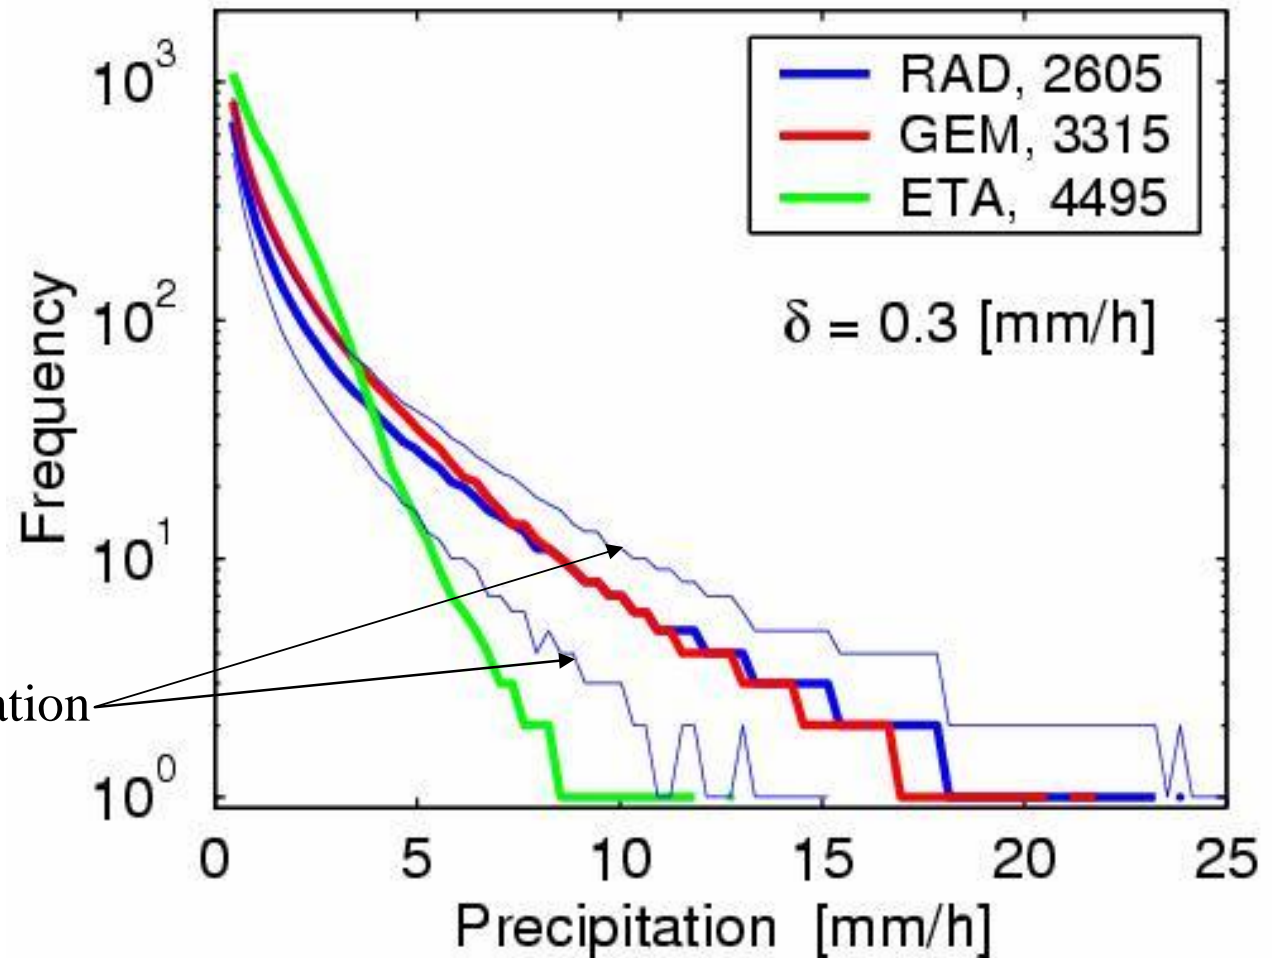

Frequency Distribution Analysis

- 21 days of 24 hourly accumulated precipitation → over 500 cases
- Domain of 2,160 km × 2,160 km at 12 km resolution → Total of 180 × 180 = 32,400 pixels
- Bin hourly precipitation of each pixel, with bin width δ
- Count frequency of precipitation for each bin → histogram

Frequency distribution of precipitation from GEM, ETA and Radar: Power law dependence

2003 & 2004, 21-ensemble

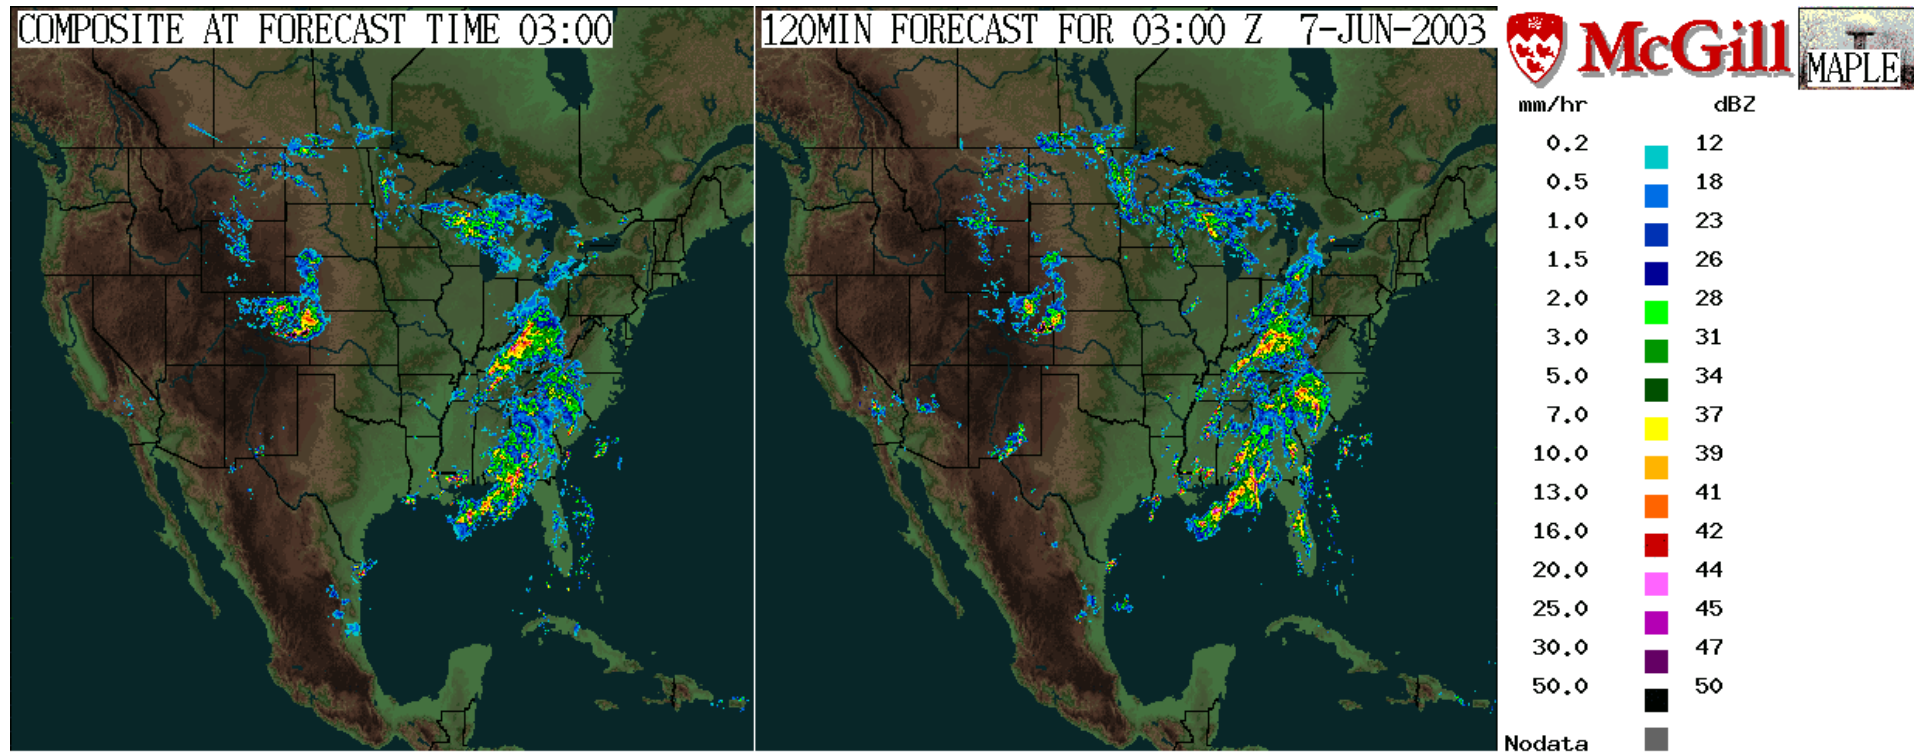

Radar: ± 1 standard deviation

Evaluate skill of precipitation forecasts from
radar nowcasts and weather prediction models

Precipitation Forecasts

- **Nowcast methods based on Lagrangian persistence of radar-retrieved precipitation**
 - *MAPLE*: McGill Algorithm for *P*recipitation forecasting using Lagrangian *E*xtrapolation
 - Germann and Zawadzki (2002), Turner et al. (2003)
- **Operational weather prediction models: Canadian **GEM-HIMAP** model and US **ETA** model.**

MAPLE precipitation radar nowcast

Observations: US
radar composite

MAPLE (2-hour nowcast)

Current News

WDT Gives CONUS a Choice in Lightning Services
A joint venture between WDT and TOA Systems, Inc., a leader in lightning detection technologies, gives America a choice in lightning data. Together we have constructed the United States Precision Lightning Network (USPLN™) which is now operational nationwide. See USPLN.com for more information.

WDT Licenses New Weather Prediction Technology from McGill University
New prediction capability provides accurate precipitation predictions out to 6 hours.

WDT Offers NEXRAD HD™
Weather Decision Technologies, Inc. announces NEXRAD HD™ — the most advanced high-definition radar product commercially available.

Compare skill of model forecasts and
radar nowcasts

Skill of Precipitation Forecasts from NWP models and Radar Nowcasts

Theoretical limit of predictability

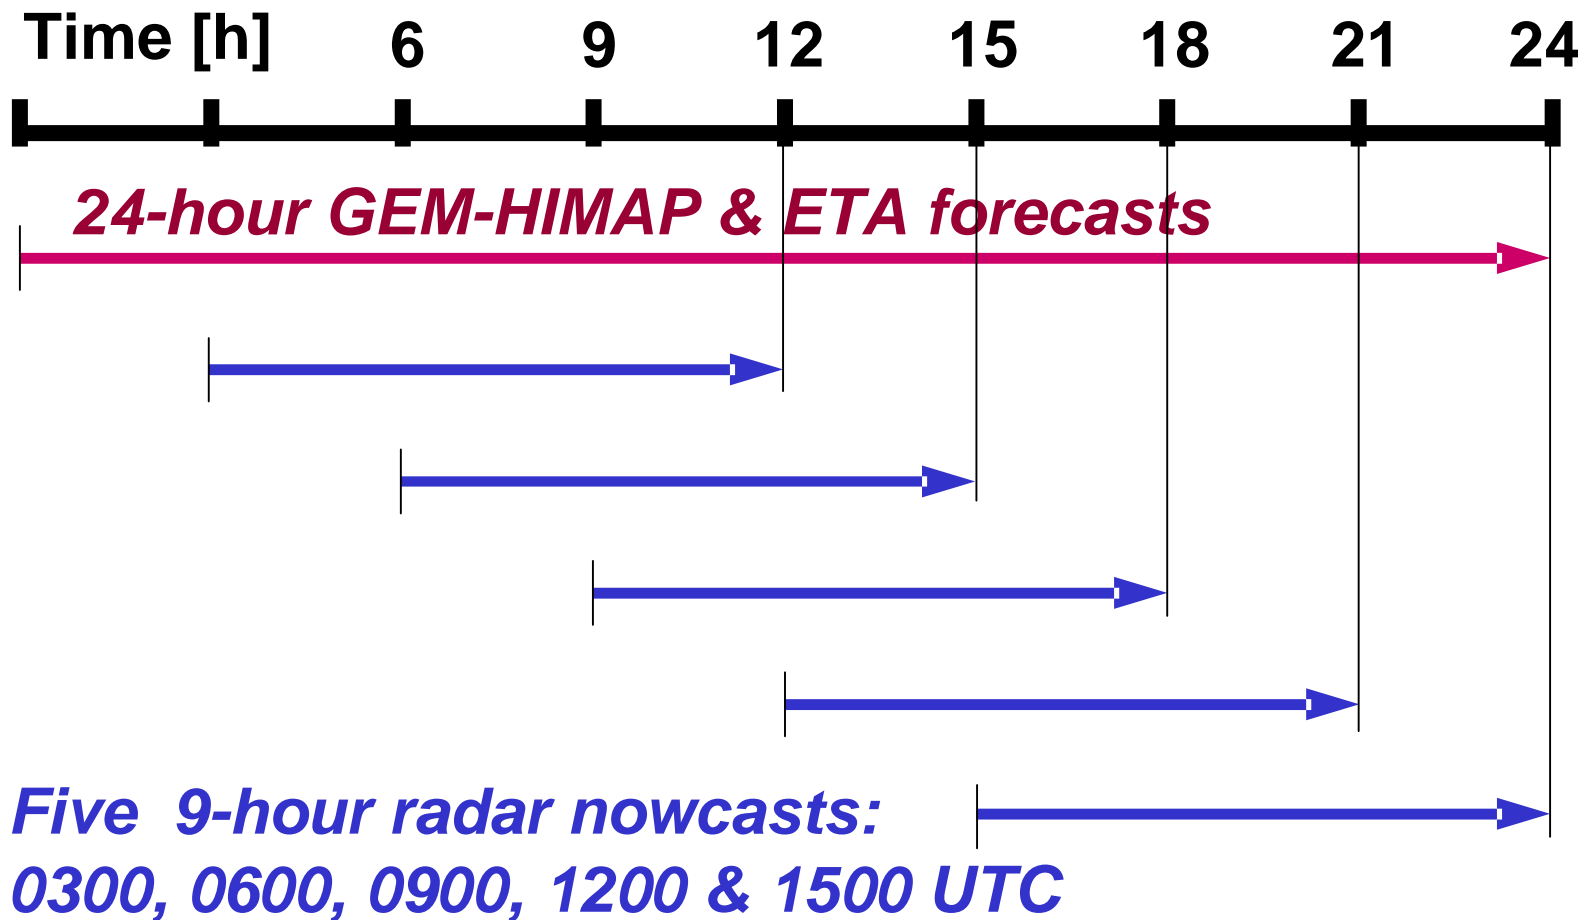

Nowcasting methods

Numerical weather prediction models

[Golding (1998), Austin et al. (1987)]

- **Examine skill**
- **Identify cross-over point**
- **Statistical blending to produce an optimal forecast**

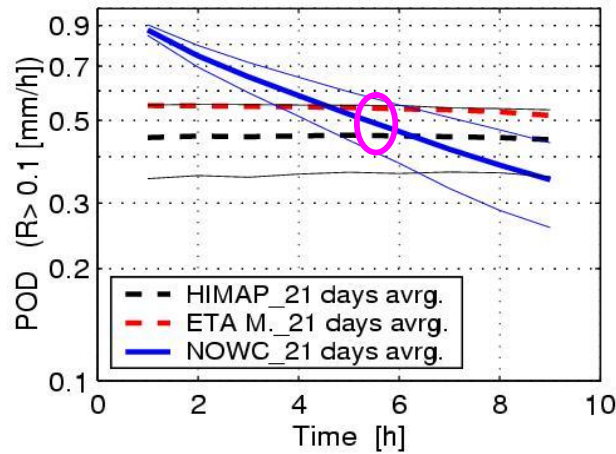

Experimental Design

21-day averaged skill scores

(500 cases of 1-hour accumulated precipitation, 2003-2004)

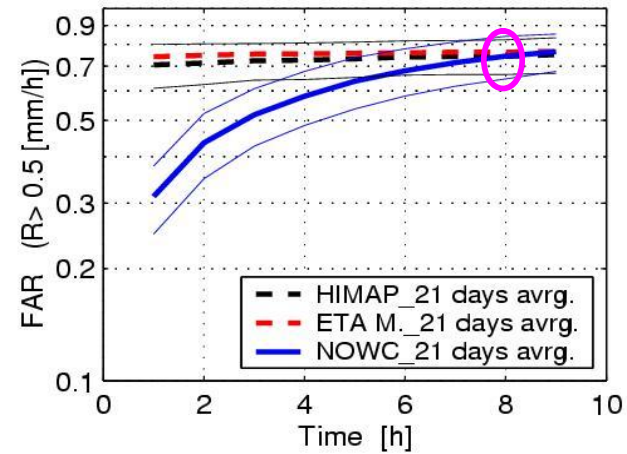

- Threshold: 0.1 mm/h -

21-day averaged skill scores

(500 cases of 1-hour accumulated precipitation, 2003-2004)

- Threshold: 0.5 mm/h -

21-day averaged skill scores

(500 cases of 1-hour accumulated precipitation, 2003-2004)

- Threshold: 0.1 mm/h -

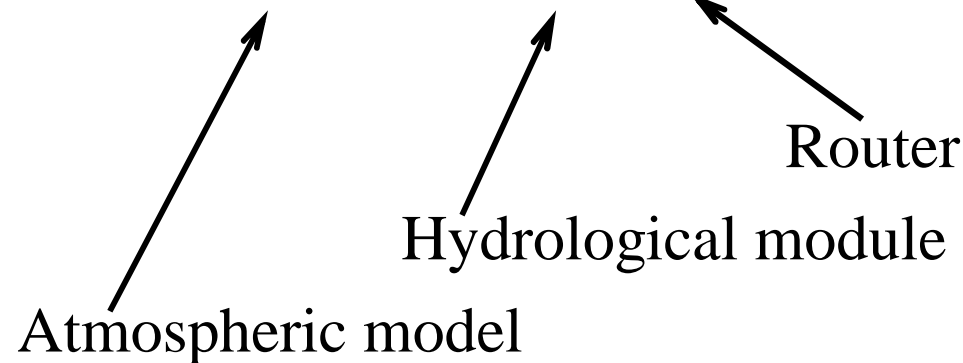

Summary and Future Work

- Skill of radar nowcasts and operational model forecasts is examined using over **500 cases of 1-hour accumulated precipitation** and conventional skill measures
- According to POD and CSI skill measures, models start to perform better than radar nowcasts after **6-7 hours**, verifying quantitatively conceptual picture
- Continue wavelet scale decomposition analysis
- Blend statistically radar nowcasts and NWP model forecasts to yield an **optimal forecast**

Application to Saguenay flood

- July 19-21, 1996: 48-hour simulation
- Ha! Ha! River basin
- 1-km GIS database for soil, vegetation, topography
- Coupled model: **MC2/CLASS/GUH**

Saguenay flood in Canada (July 19-21, 1996): 48-hour simulation with a coupled atmospheric/hydrological model

Topography of Saguenay region

Hydrological basin

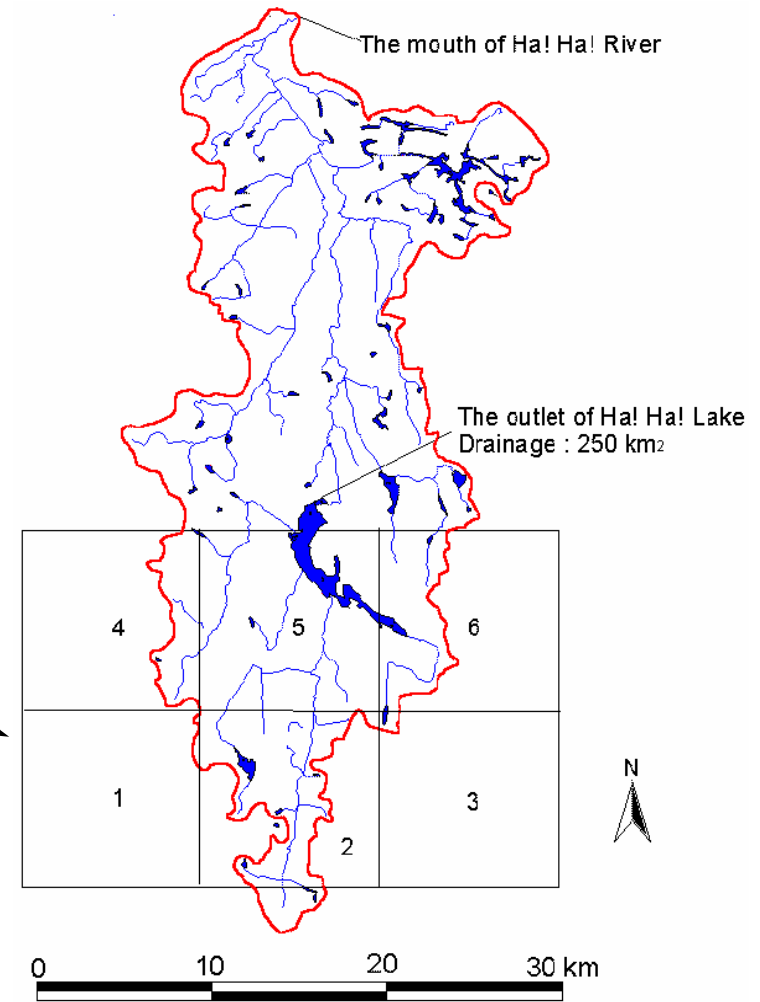

Precipitation

Flooding

CANADA

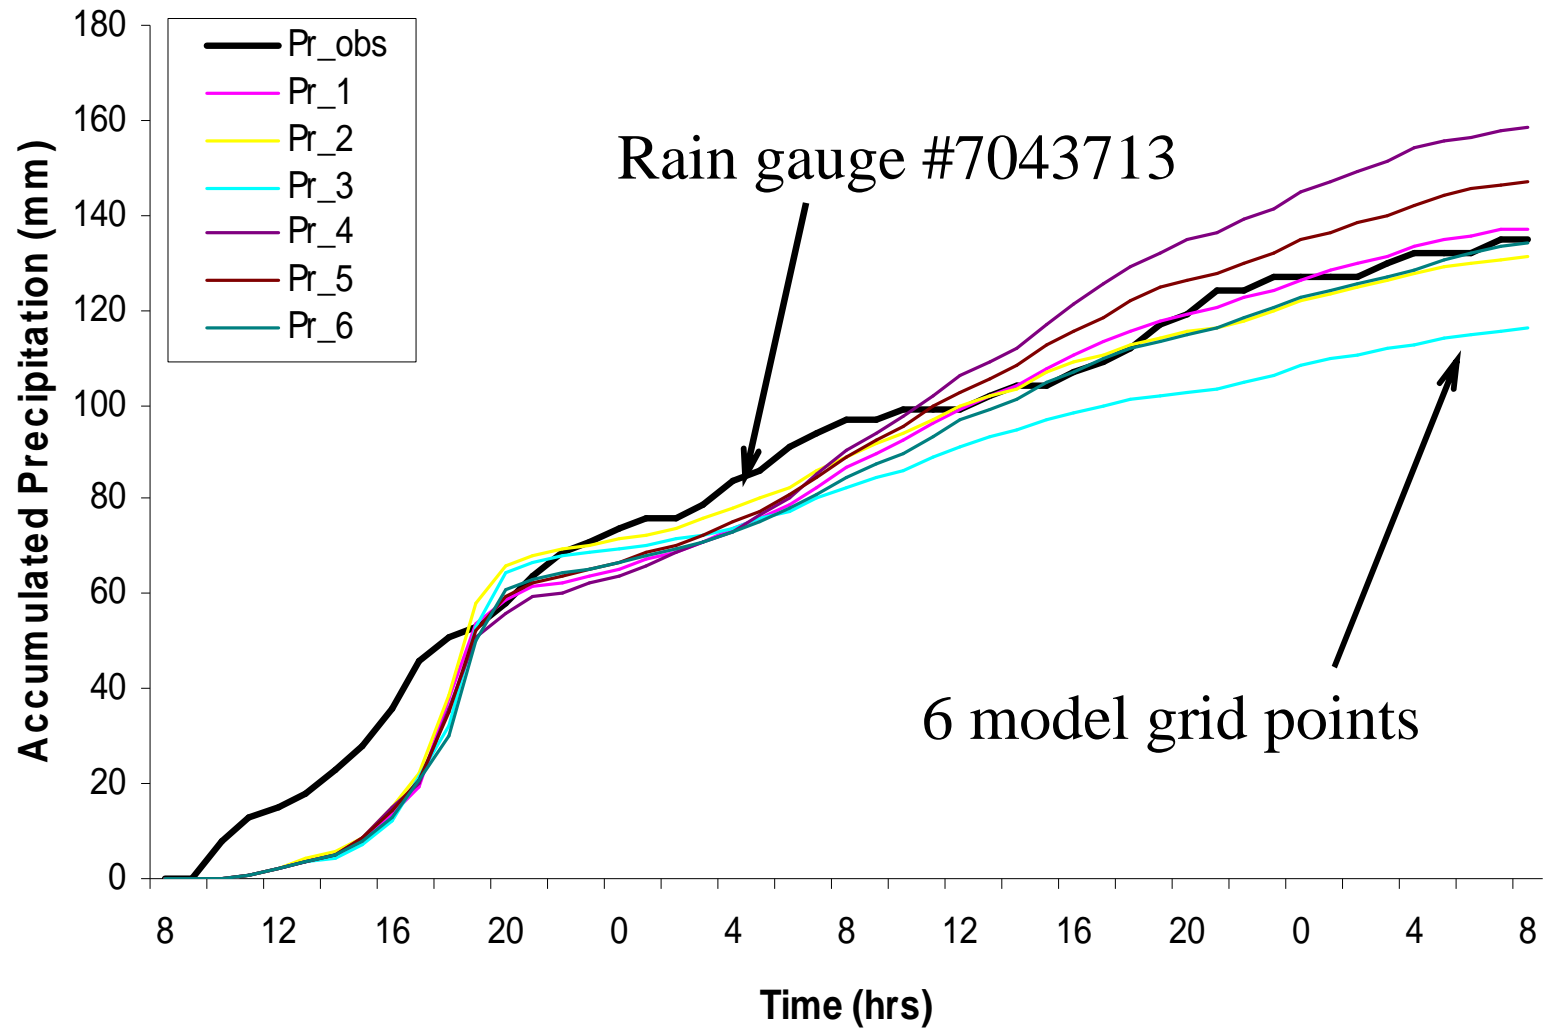

Southern Ha!Ha! River basin covered by 6 model grid points

Nearest rain gauge # 7043713

Precipitation over Ha! Ha! River basin

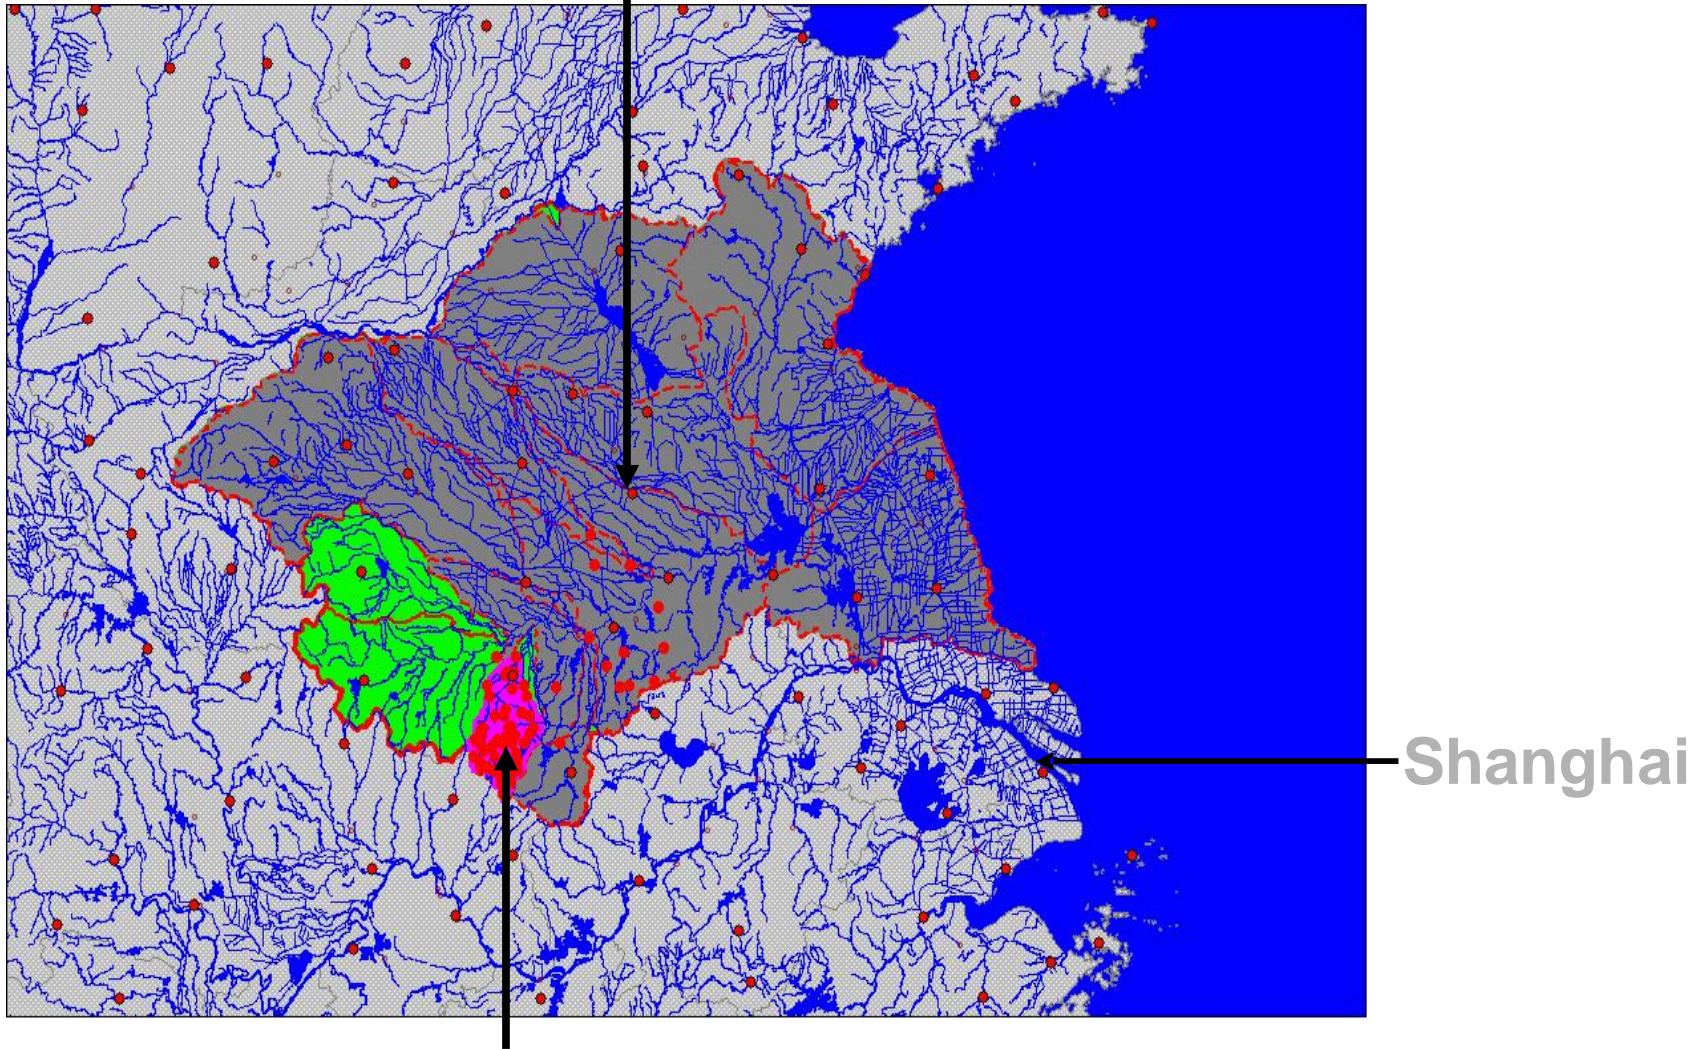

Comparison of two reconstructed hydrographs at outlet of Ha!Ha! Lake (July 19 to 21, 1996)

HUBEX/MAGE Project in China

- Ø China GEWEX project: HUBEX (HUaihe river Basin EXperiment)/MAGE (Monsoon Asian GEWEX Experiment)
- Ø IOP: May 1 to August 31, 1998
- Ø Huaihe River basin: 270,000 km²
- Ø 213 rain gauges
- Ø HUBEX/MAGE data used for model verification
- Ø Experiments: 6 heavy precipitation cases in summer of 1998 over Huaihe River basin

Huaihe River basin (270,000km²) with 213 rain-gauges (covered by 5-km domain)

Shiguanhe sub-basin (5,800 km²) with 48 rain gauges, where Xinanjiang hydrological model is applied

Hydrograph at Jiangjiaji outlet of Shiguanhe sub-basin (August 14 - 16, 1998)

Jiangjiaji outlet
Shiguanhe sub-basin

Summary

- Proof-of-concept study: coupled meteorological/hydrological models for flood forecasting
- Encouraging results from Saguenay and Chinese studies
- Continuing collaborative project with Bureau of Hydrology, Ministry of Water Resources, China

Thank you!

Model domain with surface topography

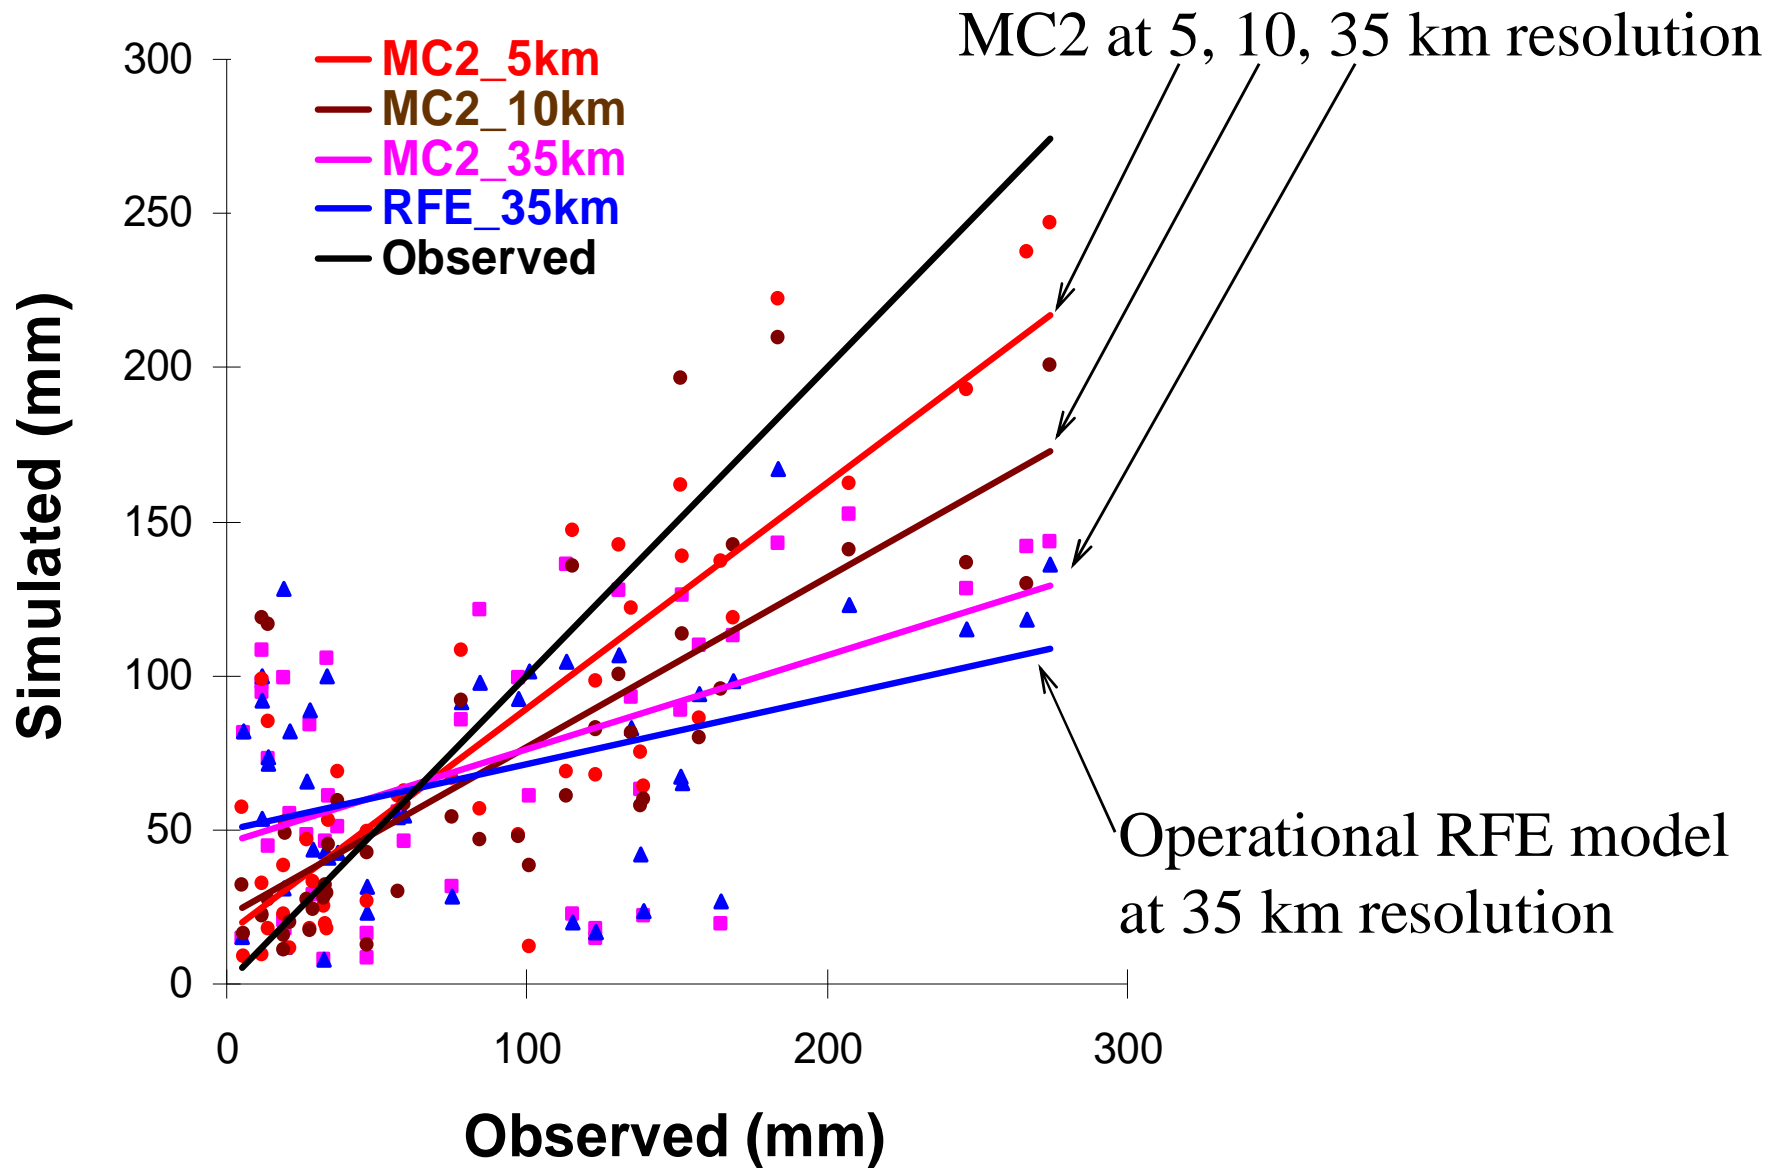

10 km resolution domain

St. Jean Lake

5 km resolution domain

Scatter plot: 48-hour accumulated precipitation (mm)

48-h Accumulated Precipitation (mm): Sensitivity to land surface (MC2/CLASS at 10 km)

Ha! Ha! River basin analysis

Ha! Ha! River basin covered by 15 model grid points (10 km \times 10 km)

Simulated runoff

- Total runoff
 - Lin et al. (2002) $3.1 \times 10^7 \text{ m}^3$
 - Lapointe et al. (1998) $3.2 \times 10^7 \text{ m}^3$
- Time of peak precipitation is about the same
- Significant difference in time of peak flow

An Assessment of MC2 Precipitation Simulation during the Intensified Observation Period of the HUBEX/MAGE Project in China

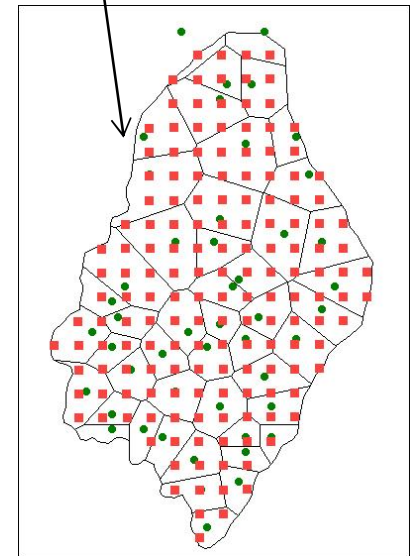

Lei Wen¹, Charles A. Lin¹, Guihua Lu², Jianyun Zhang³,
Yang Yang³, Linying Tong⁴, Yufei Zhu¹, Zhiyong Wu²

Experimental Design with MC2 and Xinanjiang hydrological model

- Ø MC2: Mesoscale Compressible Community Model
- Ø Initial run
 - horizontal resolution: 20 km
 - domain: 409 × 301 × 35 points × 40 levels
- Ø Nested run
 - horizontal resolution: 5 km
 - domain: 301 x 301 x 35 x 40
- Ø Domains centred at 33 °N, 116 °E (Huaihe River basin)
- Ø 78-hour simulation, initialized and driven by CMC global analysis (100 km resolution)
- Ø Xinanjiang hydrological model applied for **Shiguanhe sub-basin**
- Ø Experiments: 6 heavy precipitation cases in summer of 1998 over Huaihe River basin

Scatter plot for basin averaged accumulated precipitation over Shiguanhe sub-basin

48 rain gauges

Scatter plot for basin averaged accumulated precipitation over Huaihe River basin

213 rain gauges

Accumulated precipitation over Shiguanhe sub-basin for 6 cases

	MC2	Observed	Error	% Error
1998/06/28	36 (10 ⁶ m ³)	442 (10 ⁶ m ³)	-406 (10 ⁶ m ³)	-91%
1998/07/01	210 (10 ⁶ m ³)	499 (10 ⁶ m ³)	-288 (10 ⁶ m ³)	-57 %
1998/07/27	449 (10 ⁶ m ³)	372 (10 ⁶ m ³)	76 (10 ⁶ m ³)	20 %
1998/08/01	38 (10 ⁶ m ³)	54 (10 ⁶ m ³)	-16 (10 ⁶ m ³)	-29 %
1998/08/05	308 (10 ⁶ m ³)	103 (10 ⁶ m ³)	205 (10 ⁶ m ³)	199 %
1998/08/08	0 (10 ⁶ m ³)	0.4 (10 ⁶ m ³)	-0.4 (10 ⁶ m ³)	No rain
1998/08/10	7 (10 ⁶ m ³)	5 (10 ⁶ m ³)	2 (10 ⁶ m ³)	40 %
1998/08/14	497 (10 ⁶ m ³)	666 (10 ⁶ m ³)	-168 (10 ⁶ m ³)	-25 %

↑
largest case

Good agreement

Conclusions

- ∅ Initial simulation of flood events in China using MC2 with Canadian CMC analysis (100 km resolution)
- ∅ Simulation of basin averaged accumulated precipitation for 6 cases show reasonable agreement with observations, especially for large rainfall cases
- ∅ Simulated timing of peak flow agrees with observed hydrograph over the Shiguanhe basin (5,800 km²) for only one case
- ∅ Error in hydrograph is due to timing of simulated precipitation

Further Work

- ∅ Ongoing collaborative project with Hohai university and Bureau of Hydrology, Chinese Ministry of Water Resources
- ∅ Plan to use analysis from Chinese Meteorological Agency to drive MC2
- ∅ More cases will be examined (up to 20)
